2SLS estimates of the effect of a $1,000-per-worker rise in Chinese import exposure (instrumented with Chinese imports to 8 other rich countries). Outcomes are 10-year changes: employment, unemployment and workforce shares in percentage points of working-age adults; pay in log points. All models include ADH's full controls and census-division dummies, are weighted by population and cluster SEs by state. 'With better control' adds a separate slope on the 1990 factory share for each decade. Significance: *** 1%, ** 5%, * 10%.
